Contents

Introduction	ix
1. Stages of plastic deformation of polycrystalline materials	1
1.1. Introduction. Description of the problem	1
1.2. Main stages of plastic deformation of polycrystals at the mesolevel	2
1.3. Determination of the plastic deformation stages in FCC metals and solid solutions	3
1.4. Some historical data for the determination of the stages II–IV of plastic deformation in polycrystalline materials	4
1.5. Individual stages of plastic deformation in the BCC metals and alloys	5
1.6. Storage of dislocations, internal stress fields and evolution of the dislocation structure	8
1.7. Evolution of the substructure – the basics of the physics of stages in gliding of total dislocations	14
1.8. Transition to twinning and deformation martensitic transformation as an important factor of formation of stages of work hardening	17
1.9. Localisation of deformation – another reason for the formation of new stages	17
1.10. Factors complicating the characteristics of the deformation stages in meso-polycrystals	19
1.11. Effect of the mesograin size on the individual stages of plastic deformation	20
1.12. Changes of the structure of the polycrystalline aggregate and the pattern of the deformation stages with a decrease of the average grain size	23
1.13. The main factors determining the stages of deformation and the value of the work hardening coefficient in the microrange	25
1.14. Problem of determination of the grain size at the microlevel	28
1.15. Identification of plastic deformation stages at the microlevel	29
1.16. The stress σ –strain ε dependence for copper polycrystals with different nanograin sizes	31
1.17. Relationships of work hardening of copper micropolycrystals with different grain sizes	32

1.18.	Hardening mechanisms and special features of the individual stages of deformation of polycrystals with nanograins	37
1.19.	Effect of different hardening mechanisms on the flow stress and the form of the $\sigma = f(\epsilon)$ dependence	38
1.20.	Basic pattern of work hardening of nanocrystals	43
1.21.	Effect of the grain size on the parameters of plastic deformation stages	44
2.	The structure and mechanical properties of nanocrystals	50
2.1.	Introduction	50
2.2.	Classification of polycrystals on the basis of the grain size	5
2.3.	Methods for producing ultrafine-grained and nanograin polycrystalline materials	53
2.4.	The structure of polycrystalline materials	54
2.5.	Triple junctions in grains	58
2.6.	Models of polycrystalline grains at the meso- and microlevel	68
2.7.	The structure of individual nanograins	77
2.8.	Special features of the structure of the nanopolycrystalline aggregate as a consequence of high plastic strains	80
2.9.	Dependence of the dislocation density on the grain size and the problem of fine grains without dislocations	82
2.10.	Critical size ranges of the grains and areas with grains	85
2.11.	The Hall–Petch relation and its parameter σ_0 in a wide grain size range	86
2.12.	The mechanisms of implementation of the Hall–Petch relation at the mesolevel	86
2.13.	Dependence of coefficient k on the grain size in the Hall–Petch relation	90
2.14.	Problem of the transition of coefficient k to negative value. The first critical grain size	95
2.15.	Mechanisms of realisation of the Hall–Petch relation at the microlevel	101
2.16.	Mechanisms providing contribution to the grain boundary sliding process	105
2.17.	The number of dislocations in the shear zone and the stress, required for the formation of this zone	105
2.18.	Contact stresses. Conventional and accommodation sliding	109
2.19.	Conclusion	114
3.	Main components of the dislocation structure and the role of the dimensional factor	120
3.1.	Problem of classification of dislocation structure components	120
3.1.1.	Components of the dislocation structure	120
